EQ-30 SERIES

Adjustable Long Range & Fixed-focus Reflective Photoelectric Sensor Amplifier Built-in

Unaffected by color or material, 2 m (6.562 ft) distance adjustable fixed-focus sensing

Not affected by object color or background

As the EQ-30 series is incorporated with a 2-segment photodiode as the receiving element with a unique circuitry, it detects an object at the same distance regardless of its color or the background beyond the adjusted sensing range.

However, when the background is specular, it may be necessary to change the angle of the sensor.

These bars indicate the sensing range with the respective objects when the distance adjuster is set at the sensing range of 2 m 6.562 ft, 1 m 3.281 ft and 0.2 m 0.656 ft long, each, with white non-... 0.2 m glossy paper.

Long sensing range 2 m 6.562 ft

The EQ-30 series can detect an object 2 m 6.562 ft away.

It is suitable for various applications, such as, sensing objects or positioning objects traveling on a wide assembly line, etc.

Two distances (far and near) can be set EQ-34W

With EQ-34W, two sensing distances, Far (Main) and Near (Sub), can be set. Hence, one sensor can suffice where, earlier, two were required.

Compact

It saves space, since a miniaturized housing of W20 \times H68 \times D40 mm $W0.787 \times H2.677 \times D1.575$ in has been designed for the fixed-focus sensing sensor even though the adjustable sensing range is 2 m 6.562 ft long.

Insusceptible to contamination on lens

The fixed-focus sensing keeps the detectability better than diffuse reflective type sensors even if the lens is contaminated by dirt, dust, mist, or smoke under an unclean environment.

APPLICATIONS

Detecting traveling cardboard boxes

Detecting people in front of automatic door

Detecting level in hopper

Automatic interference prevention

The EQ-30 series is the first fixedfocus sensing reflective type sensor to incorporate an automatic interference prevention function so that two sets of sensors can be installed close together or facing each other.

Mechanical 2-turn adjuster with indicator

It features a mechanical 2-turn distance adjuster with an indicator that shows the set distance at a glance.

Waterproof

It has IP67 protection. It can be used in places splashed with water.

Note: However, take care that if it is exposed to water splashes during operation, it may detect a water drop itself.

Plug-in connector type is available

Plug-in connector type, which can be easily disconnected for replacement is available. In case a problem occurs, anyone can replace the sensor in a minute. (Excluding EQ-34W)

Principle of fixed-focus sensing with 2-segment photodiode

Normal reflective type sensors operate by sensing the variation in the amount of incident beam. However, the fixed-focus reflective sensing type sensor incorporating the 2-segment photodiode operates by sensing the variation in the incident beam angle. Thus, the output is activated according to the distance of the object from the sensor.

This system helps the **EQ-30** series in being unaffected by object color or a background, enabling stable sensing.

Sensing is based on the difference in the incident beam angle of the dotted line and the solid line in the above figure.

ORDER GUIDE

Туре	Appearance	Adjustable range (Note)	Model No.	Output
NPN output			EQ-34	NPN open-collector transistor
PNP output		0.2 to 2 m 0.656 to 6.562 ft	EQ-34-PN	PNP open-collector transistor
Two outputs			EQ-34W	Two NPN open-collector transistor outputs

NOTE: Mounting bracket is not supplied with the sensor. Please select from the range of optional sensor mounting brackets (two types).

Note: The adjustable range stands for the maximum sensing range which can be set with the adjuster. The sensor can detect an object 0.1 m 0.328 ft, or more, away.

However, the detectable range of Near (Sub) type of **EQ-34W** begins at 0.2 m 0.656 ft.

Plug-in connector type, 5 m 16.404 ft cable length type

Plug-in connector type (standard: cable type) and 5 m 16.404 ft cable length type (standard: 2 m 6.562 ft) are also available.

• Table of Model Nos.

Type Standard		Plug-in connector type (Note)	5 m 16.404 ft cable length type
NPN output	EQ-34	EQ-34-J	EQ-34-C5
PNP output	EQ-34-PN	EQ-34-PN-J	
Two outputs	EQ-34W		EQ-34W-C5

Note: Please order the suitable mating cable separately.

PRECAUTIONS FOR PROPER USE

Refer to p.1135~ for general precautions.

This product is not a safety sensor. Its use is not intended or designed to protect life and prevent body injury or property damage from dangerous parts of machinery. It is a normal object detection sensor.

Stability indicator

• Since the EQ-30 series uses a 2-segment photodiode as its receiving element, and sensing is done based on the difference in the incident beam angle of the reflected beam from the sensing object, the output and the operation indicator operate according to the object distance

Further, the stability indicator shows the margin of the incident light intensity and not that of the object distance. Hence, the distance at which it lights up/off depends on the object reflectivity and is not at all related to the output operation. Do not use the sensor when the stability indicator is off (unstable light received condition), since the sensing will be unstable.

Others

- Do not use during the initial transient time (50 ms) after the power supply is switched on.
- · When connecting the mating cable to the plug-in connector type, the tightening torque should be 0.4N·m or less.

Mounting

• The tightening torque should be 0.8 N·m or less.

 Care must be taken regarding the sensor mounting direction with respect to the object's direction of movement.

Do not make the sensor detect an object in this direction because it may cause unstable operation.

- When detecting a specular object (aluminum or copper foil) or an object having a glossy surface or coating, please take care that there are cases when the object may not be detected due to a small change in angle, wrinkles on the object surface, etc.
- · When a specular body is present below the sensor, use the sensor by tilting it slightly upwards to avoid wrong operation.

- · If a specular body is present in the background, wrong operation may be caused due to a small change in the angle of the background body. In that case, install the sensor at an inclination and confirm the operation with the actual sensing object.
- Take care that some objects may produce a dead zone right in front of the sensor.

PRECAUTIONS FOR PROPER USE

Refer to p.1135~ for general precautions.

Distance adjustment
