Ultra small size sensors in plastic housing

E3T

- Ultra small size with high power pin point LED where space is crucial
- 3.5 mm thin flat shape or 7 mm wide side view shape

Features

4 detection methods for selection according to work and space

Through-beam model

The side-view type has realized long, 1 m distance detection. Furthermore, it can detect a small, 0.5 mm or less dia. work with a pin-point beam (when slit is fitted). The visible light spot and narrow-visibility beam ensure a stable detection of lead frames and chip parts.

Diffuse reflective model

3.5 mm thin size and can be installed to a gap etc. The pin-point beam makes sensing position check easy, and the sensor is insensitive to the background and surrounding metal, ensuring stable detection.

Limited reflective model

Having the smallest size, this type can detect a merely 0.15 mm small object. In addition to this, it is insensitive to the background and surrounding metal, thus, ensuring a stable detection. The pin-point beam allows a clear vision of a red light spot, facilitating a sensing position check.

Retroreflective model

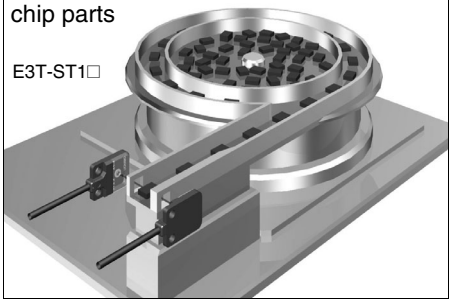
The world first coaxial Retroreflective type in this size. When used with a small reflector, this sensor completes 2 mm dia. small work detection and 200 mm sensing distance. The switch detects small works, such as IC chips on tape, and the pin-point beam makes optical axis adjustment easy, achieving stable detection.

Application

Through-beam

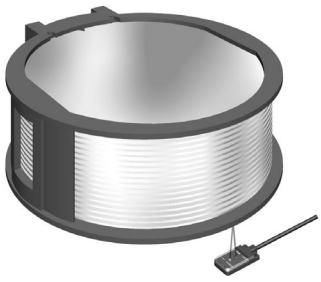
Detection of passing/staying parts on parts feeder
Stable detection of small works such as chip parts

E3T-ST1□



Diffuse-reflective

Detection of seated wafer cassette
Thin size. Can be mounted to a gap or like.

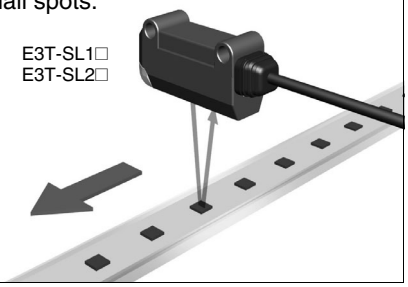


E3T-FD1□

Limited reflective

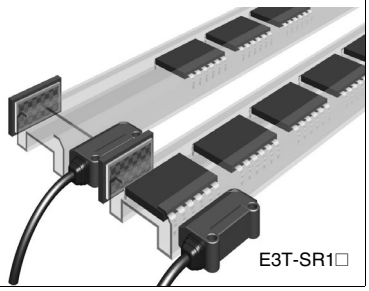
Detection of chip parts on tape (Taping machine)
Can detect small parts on 1 mm dia. small spots.

E3T-SL1□
E3T-SL2□



Retroreflective Models

Detection of stick full of ICs (IC handler/ DIP.SOP)
Retroreflection halves wiring man-hours.

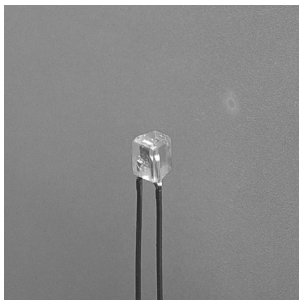


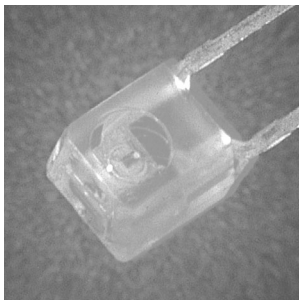
E3T-SR1□

Features

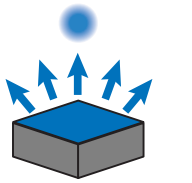
The hyper LED issues a 0.8 mm dia. pin-point beam (E3T-SL1□) Small works can be detected

The hyper LED performs a high-output narrow-visibility beam of 0.8 mm spot diameter (E3T-SL1□). A red spot can be seen clearly and optical axis alignment and detection position check become easy. Besides, the LED is insensitive to the work color and background and can detect a small work securely.

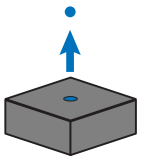




High output pin-point light source LED (wave length: 650 mm)



The conventional LED emits light from its surface. It has a large degree of light dispersion, increasing the loss when creating a small beam.



The hyper LED emits light from a small point. It has a small degree of light dispersion, achieving a loss-free, high-output, narrow-visibility beam.

E3T-ST	Conventional through-beam type	
One-chip photo IC ensures high reliability.

The incident photo diode and analog/digital signal processing circuit are integrated densely into the one-chip fully customized IC in use. This photoelectric sensor has high reliability in the ultra small size.

Equipped with OMRON's original FAO, this photoelectric sensor has achieved the world's first coaxial retroreflective type.

The FAO (FREE ANGLE OPTICS), or special beam splitter having multiple layers of dielectric films on a glass, has implemented the ultra small coaxial retroreflection. It can detect a small 2 mm dia. work, provides sensing position accuracy equivalent to that of the through-beam type, reducing wiring man-hours.

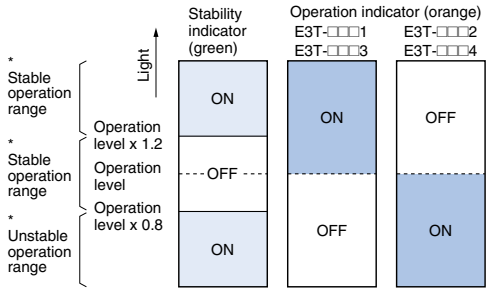
Precautions

For adjustment

Display

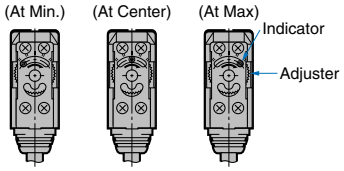
- The following graphs indicate the status of each operation level.
- Be sure to use the E3T within the stable operating range.



Note: If the E3T's operation level is set to the stable operation range, the E3T will be in most reliable operation without being influenced by temperature change, voltage fluctuation, dust, or setting change. If the operation level cannot be set to the stable operation range, pay attention to environmental changes while operating the E3T.

Use of E39-E10 Sensitivity Adjustment Unit

(Dark ON: E3T-ST12)



① Install the Unit on the Receiver.

② Set the adjustment dial of the sensitivity adjustment unit to Max. (Factory set to the Max. position)

③ After Sensor installation adjust the optical axis and secure the Sensor.

④ Place a work between the emitter and receiver, gradually turn the adjustment dial of the sensitivity unit to the Min position (CCW), and stop turning it when the operation indicator is turned ON and the stability indicator (green) is turned ON.

⑤ Remove the work and confirm that the operation indicator is turned OFF and the stability indicator (green) is turned ON. This completes the adjustment.

Note: If the light attenuation rate due to a work is 40% or less, the stability indicator is not turned ON whether or not light is received. When the variation of light is small (e.g. when sensing semi-transparent works), carefully perform preliminary testing.

Others

Do not install the E3T in the following places.

- Places where the E3T is exposed to direct sunlight.
- Places with high humidity and where condensation may result.
